The fifth chapter of O'Neill's "The Geometry of Kerr Black Holes" contains an amazingly lucid discussion of the Weyl curvature tensor and its use in assigning Petrov Types to spacetimes. This chapter alone is worth the price of the entire book. Again, a comparison of this chapter with the related Chapter 4 in Stephani, Kramer, et. al.'s well-known "Exact Solutions to Einstein's Field Equations, 2nd Ed.," will

The Geometry of Black Holes Einstein's equations and the Schwarzschild solution Schwarzschild Geometry IV: Light rays At every spacetime point, we have a light cone sitting in its tangent space. The radial (that is, $d^2 = d^2 = 0$) light rays are described by $dt dr = \pm r^2 M(13)$ However, it turns out that, in a n^2 parametrization, $r=0$ for a light ray - an incoming one goes to $t \dots$

Dynamical black holes are introduced next via the study of exact solutions describing the formation of a black hole by gravitational collapse (Vaidya and Lemaître-Tolman solutions). The Kerr solution is then examined, as well as its maximal extension. This is followed by a course on black hole thermodynamics. The quasi-local approach, based on the concept of trapping horizons, is then briefly ...
